

I'd like to say that I'm opposed to IBOC on the FM band. From what I read it appears that the increased bandwidth of the IBOC signal will make it impossible for stations on channels adjacent to other stations to exist. For example, in this area we can listen to Laser 99.3 in Northampton, MA and also 99.1 WPLR in New Haven. With IBOC, Northampton will be gone from our radio dial.

I imagine that many of the smaller stations will just fold up and shut down rather than spend the money in converting.

Why try to fix something that isn't broken?????
